Numbering of the technical components and the electrical connections

1. One heating circuit without mixer, with low loss header

ID: 4605521_1604_05

Applications

Heating system with one unregulated radiator heating circuit (30):

- With low loss header (4)
(see "Requirements")

DHW heating by the Vitodens.

Requirements

If the total flow rate of all heating circuits exceeds the max. possible flow rate of the boiler (see table), a low loss header (4) must be installed.

Boiler	Max. flow rate l/h
Vitodens 200-W, 12 - 49 kW	3500
Vitodens 200-W, 12 - 60 kW	3500
Vitodens 200-W, 20 - 80 kW	5700
Vitodens 200-W, 20 - 99 kW	5700
Vitodens 200-W, 32 - 120 kW	7165
Vitodens 200-W, 32 - 150 kW	8600

We recommend installing a low loss header (4) if the minimum flow rates listed in the table below cannot be guaranteed.

Boiler	Minimum flow rate l/h
Vitodens 200-W, 12 - 49 kW	450
Vitodens 200-W, 12 - 60 kW	450
Vitodens 200-W, 20 - 80 kW	1300
Vitodens 200-W, 20 - 99 kW	1300
Vitodens 200-W, 32 - 120 kW	3600
Vitodens 200-W, 32 - 150 kW	3600

Main components

- Vitodens 200-W gas condensing boiler (1), 49 to 150 kW
- Vitotronic 100 (for constant temperature mode) or Vitotronic 200 (for weather-compensated mode)

Required codes

ID: 4605521_1604_05

Group	Code	Function
"General/Group 1"	"82:1"	For operation with LPG (select code 11:9)
	System without DHW circulation pump	
	"53:2"	Heating circuit pump A1 connected at internal H1 extension
	System with DHW circulation pump	
	"33:1"	Heating circuit pump A1 connected to AM1 extension at terminal A1 (delivered condition)
"DHW"	"34:0"	DHW circulation pump connected to AM1 extension at terminal A2 (delivered condition)
	"5b:1"	DHW cylinder connected downstream of the low loss header (Only set if the DHW cylinder is connected downstream of the low loss header.)

- Heating circuit connection set (6) with circulation pump

- Low loss header (4)

- DHW heating:

- DHW cylinder connection set (12) with circulation pump for cylinder heating.

- Alternatively:

- Connect the circulation pump for cylinder heating downstream of the low loss header (4).

Note:

When operating a DHW cylinder, ensure that the heating output of the boiler can be transferred to the DHW cylinder as continuously as possible. In borderline situations, we recommend operating the DHW cylinder in parallel mode between heating circuit pump and circulation pump for cylinder heating (no DHW priority). For this, we recommend installing the DHW cylinder in the secondary side of the heating system (downstream of the low loss header).

Function description

Circulation pump (6) supplies heating circuit (30) or the boiler circuit up to the low loss header. DHW cylinder (10) is supplied by circulation pump (12).

In systems with a low loss header, on-site heating circuit pump (30) supplies heating circuit (30).

Heating operation

Control unit (2) of boiler (1) regulates the boiler water temperature (= flow temperature of heating circuit (30)) in weather-compensated or room temperature-dependent mode.

Heating circuit pump (30) of radiator heating circuit (30) is controlled by internal H1 extension (77) / H2 (78) or AM1 extension (79).

DHW heating by boiler

If the set DHW temperature selected at control unit (2) is undershot, circulation pump for cylinder heating (12) is started.

During the periods selected at control unit (2), DHW is heated with or without priority control.

DHW circulation pump (13) is connected at AM1 extension (79), in line with system equipment.

Note

This scheme is a general system example. Please refer to the appropriate technical guides when designing specific applications.

Note

Regarding electrical connection x/x:

Subject to system equipment, heating circuit pump ③③ is connected to the internal H1, H2 or AM1 extension, DHW circulation pump ZP ⑬ is connected to AM1 extension ⑦⑨.

Electrical installation scheme

ID: 4605521_1604_05

2. One heating circuit without mixer with separate heating circuit pump and two heating circuits with mixer, with low loss header

ID: 4605524_1604_05

Applications

Heating system with unregulated heating circuit (30) and:

- Controlled radiator heating circuit (40) and
- Controlled underfloor heating circuit (50) with system separation (57) DHW heating by the Vitodens.

Requirements

The total flow rate of both heating circuits is greater than the max. possible flow rate of the boiler (see table), therefore a low loss header (4) must be installed.

Boiler	Max. flow rate l/h
Vitodens 200-W, 12 - 49 kW	3500
Vitodens 200-W, 12 - 60 kW	3500
Vitodens 200-W, 20 - 80 kW	5700
Vitodens 200-W, 20 - 99 kW	5700
Vitodens 200-W, 32 - 120 kW	7165
Vitodens 200-W, 32 - 150 kW	8600

Main components

- Vitodens 200-W gas condensing boiler (1), 49 to 150 kW
- Vitotronic 200 (for weather-compensated mode)
- Heating circuit connection set with circulation pump (6)
- Low loss header (4)
- DHW heating:
 - DHW cylinder connection set (12) with circulation pump for cylinder heating.
- Alternatively:
 - Connect the circulation pump for cylinder heating downstream of the low loss header (4).

Note:

When operating a DHW cylinder, ensure that the heating output of the boiler can be transferred to the DHW cylinder as continuously as possible. In borderline situations, we recommend operating the DHW cylinder in parallel mode between heating circuit pump and circulation pump for cylinder heating (no DHW priority). For this, we recommend installing the DHW cylinder in the secondary side of the heating system (downstream of the low loss header).

Function description

Heating circuit connection set (6) with circulation pump supplies the boiler circuit up to the low loss header. DHW cylinder (10) is supplied by DHW cylinder connection set (12) with circulation pump for cylinder heating.

Heating circuit pump (33) supplies radiator heating circuit (30).

Heating circuit pump (43) supplies radiator heating circuit (40).

Heating circuit pump (53) supplies underfloor heating circuit (50).

Circulation pump (58) supplies the primary circuit of plate heat exchanger (system separation) (57).

Heating operation

Heating circuit without mixer

Control unit (2) of boiler (1) regulates the boiler water temperature (= flow temperature of heating circuit without mixer (30)) in weather-compensated mode.

Heating circuit pump (33) of radiator heating circuit (30) is controlled by internal H1 extension (77) or H2 extension (78) or AM1 extension (79).

Heating circuit with mixer

The extension kits for one heating circuit with mixer (45) / (55) control the flow temperature of underfloor heating circuit (50) or radiator heating circuit (40) in weather-compensated mode.

The boiler water temperature is raised by the differential temperature set at control unit (2) of boiler (1).

Heating circuit pump (43) of the radiator heating circuit is controlled by mixer extension kit (45).

Heating circuit pump (53) and circulation pump (58) (only with system separation) of underfloor heating circuit (50) are controlled by mixer extension kit (55).

The maximum temperature of underfloor heating circuit (50) is restricted via temperature limiter (56).

DHW heating by boiler

If the set DHW temperature selected at control unit (2) is undershot, circulation pump for cylinder heating (12) is started.

During the periods selected at control unit (2), DHW is heated with or without priority control.

DHW circulation pump (13) is connected at AM1 extension (79), in line with system equipment.

Note

This scheme is a general system example. Please refer to the appropriate technical guides when designing specific applications.

3. Multi boiler system with several heating circuits with mixer and low loss header

ID: 4605525_1604_04

Applications

Heating system with different heating circuits:

- Controlled radiator heating circuit (30) with 3-way mixer and
 - Controlled underfloor heating circuit (40) with 3-way mixer
- DHW heating by the Vitodens

Main components

- Vitodens 200-W multi boiler system (1), 49 to 99 kW with:
 - Hydraulic cascade
 - Low loss header
 - Vitotronic 100 for every boiler
 - Vitotronic 300-K
 - Connection accessories
- DHW cylinder (10)

Function description

Circulation pumps (6) / (7) integrated into the connection accessories supply the boiler circuit up to the low loss header. DHW cylinder (10) is supplied by circulation pump (12).

Required codes

ID: 4605525_1604_04

Codes Vitotronic 300-K

Group	Code	Function
"General"	"00:7"	System with two heating circuits with mixer, without DHW heating, without unregulated heating circuit.
	or "00:8"	System with two heating circuits with mixer, with DHW heating, without unregulated heating circuit.

Boiler 2

"Group 2"	"01:2" "07:2"	Multi boiler system with Vitotronic 300-K Boiler number 2
-----------	------------------	--

Heating circuit pumps M2, M3 (33) / (43) supply heating circuits (30) / (40).

Heating operation

Heating circuits with mixer

Circulation pumps (6) / (7) integrated into the connection accessories are started subject to demand.

The underfloor heating circuit and radiator heating circuits are each supplied by a separate circulation pump. Each heating circuit is controlled by the Vitotronic 300-K (2) via an extension kit for heating circuit with mixer.

A Vitotronic 200-H, type HK1B, is additionally required if three heating circuits with mixer are to be connected. A Vitotronic 200-H, type HK3B, is additionally required if four or more heating circuits with mixer are to be connected.

The flow rate of underfloor heating circuit (40) is subject to individual design criteria and is balanced by an adjustable bypass.

The maximum temperature of underfloor heating circuit (40) is restricted by temperature limiter (46).

DHW heating

If the set DHW temperature selected at control unit (2) is undershot, loading pump for cylinder heating UPSB (12) is started.

Within the periods selected at the control unit, DHW is heated with or without priority. Priority control can be set separately for each heating circuit.

DHW circulation pump (13) is connected to control unit (2).

Note

This scheme is a general system example. Please refer to the appropriate technical guides when designing specific applications.

The diagram illustrates the wiring for the 300-K terminal block, organized into two main sections: the top section for power and signal, and the bottom section for control and signal.

Top Section (300-K):

- Power Input:** 230 V/50 Hz, connected to terminals 156, 40, 50, 29, 20, and 52.
- Signal Lines:**
 - Terminals 21 and 28 are connected to M1-.
 - Terminals 146, 143, 17B, 17A, 5B, 5A, and 3/2 are connected to various signal lines.
 - Terminals 145 and 1 are connected to LON lines.

Bottom Section (300-K):

- Power Input:** 230 V/50 Hz, connected to terminals 40, 40A, and 157.
- Signal Lines:**
 - Terminals 0-10V, DE3, DE2, and DE1 are connected to various signal lines.
 - Terminals 145 and 1 are connected to LON lines.

The diagram includes various symbols for power (M1-), signal (M1-), and control (M1-), as well as a note about the 300-K terminal block.

Electrical installation scheme

ID: 4605525_1604_04

4. Three or more heating circuits with mixer, low loss header and solar DHW heating

ID: 4605527_1604_05

Applications

Heating system with different heating circuits:

- Controlled heating circuits (30) / (40) and
 - Controlled underfloor heating circuit (50)
- DHW heating by Vitodens (1) and solar thermal system (20).

Requirements

The total flow rate of all heating circuits is greater than the max. possible flow rate of the boiler (see table), therefore a low loss header (4) must be installed.

Boiler	Max. flow rate l/h
Vitodens 200-W, 12 - 49 kW	3500
Vitodens 200-W, 12 - 60 kW	3500
Vitodens 200-W, 20 - 80 kW	5700
Vitodens 200-W, 20 - 99 kW	5700
Vitodens 200-W, 32 - 120 kW	7165
Vitodens 200-W, 32 - 150 kW	8600

Main components

- Vitodens 200-W gas condensing boiler (1), 49 to 150 kW
- Vitotronic 200 (for weather-compensated mode)
- Heating circuit connection set (6) with circulation pump
- Low loss header (4)
- DHW heating by the Vitodens, no solar thermal system:
 - DHW cylinder connection set (12) with circulation pump for cylinder heating.
- Alternatively:
 - Connect the circulation pump for cylinder heating downstream of the low loss header (4).
- DHW heating by the Vitodens and a solar thermal system:
 - DHW cylinder (29)
 - Solar thermal system (20)

Note:

When operating a DHW cylinder, ensure that the heating output of the boiler can be transferred to the DHW cylinder as continuously as possible. In borderline situations, we recommend operating the DHW cylinder in parallel mode between heating circuit pump and circulation pump for cylinder heating (no DHW priority). For this, we recommend installing the DHW cylinder in the secondary side of the heating system (downstream of the low loss header).

Function description

Heating circuit connection set (6) with circulation pump supplies the boiler circuit up to the low loss header. DHW cylinder (10) is supplied by DHW cylinder connection set (12) with circulation pump for cylinder heating.

Heating circuit pumps M2 (33), M3 (43) and M1 (53) supply heating circuits (30) / (40) / (50).

Heating operation

Heating circuits with mixer

The underfloor heating circuit and radiator circuits are each supplied by a separate circulation pump (33) / (43) / (53). Heating circuits (30) / (40) are controlled via extension kits for mixers (35) / (45) respectively. Heating circuit (50) is controlled via a Vitotronic 200-H, type HK1B (57).

The boiler water temperature is controlled according to the highest demand (flow temperature increased by an adjustable differential temperature).

The flow rate of underfloor heating circuit (50) (without system separation) is subject to individual design criteria and is balanced by an adjustable bypass.

The maximum temperature of underfloor heating circuit (50) is restricted via temperature limiter (56).

DHW heating by boiler

If the set DHW temperature selected at control unit (2) is undershot, circulation pump for cylinder heating UPSB (12) is started.

During the periods selected at control unit (2), DHW is heated with or without priority control.

DHW circulation pump ZP (13) is connected to internal H1 extension (77) or H2 extension (78).

DHW heating by the solar thermal system

If the temperature differential between collector temperature sensor (25) and cylinder temperature sensor (24) exceeds the start temperature differential, solar circuit pump (23) is started and DHW cylinder (29) is heated.

Solar circuit pump (23) is stopped according to the following criteria:

- The stop temperature differential is undershot
- The electronic temperature limit (max. 90 °C) of solar control module (type SM1) (24) is exceeded
- The temperature selected at high limit safety cut-out (28) (if installed) is reached

The requirements for the auxiliary function (see Vitosol technical guide) are met by circulation pump (15).

Circulation pump (15) starts when the start temperature differential (of the second temperature differential controller) at cylinder temperature sensor (27) has exceeded the temperature at cylinder temperature sensor (26). The water heated in DHW cylinder 1 (29) is routed into DHW cylinder 2 (10).

Circulation pump (15) is switched off when the stop temperature differential (of the second temperature differential controller) at cylinder temperature sensor (27) has fallen below the temperature at cylinder temperature sensor (26).

Suppression of DHW cylinder reheating by the boiler in conjunction with the solar control module (type SM1)

Reheating is suppressed in two stages.

Reheating of DHW cylinder 2 (10) by boiler (1) is suppressed as soon as DHW cylinder 1 (27) is heated by collectors (21). For this, the set cylinder temperature for reheating by boiler (1) is reduced. Suppression remains active for a certain time after solar circuit pump (23) has stopped.

In the case of uninterrupted heating by collectors (21) (> 2 h), boiler (1) will only reheat if the set cylinder temperature (coding address "67") selected at boiler control unit (2) is undershot.

Coding address "67" in control unit (2) is used to specify a 3rd set DHW temperature (setting range 10 to 95 °C). This value must be below the 1st set DHW temperature.

DHW cylinder 2 is only heated by boiler (1) if this set value cannot be achieved by the solar thermal system.

Note

This scheme is a general system example. Please refer to the appropriate technical guides when designing specific applications.

Required codes**ID: 4605527_1604_05**

Group	Code	Function
"General/Group 1"	"82:1"	For operation with LPG (select code 11:9)
"General"	"00:7"	System with only one heating circuit with mixer, without DHW heating, without unregulated heating circuit.
	or	
	"00:8"	System with only one heating circuit with mixer, with DHW heating, without unregulated heating circuit.
	"77:1"	Subscriber no.
	"79:1"	Control unit is fault manager
"Boiler"	"7b:1"	Control unit transmits time via LON
	"97:2"	Control unit transmits outside temperature via LON
	"30:?"	Observe the settings for the heating circuit / boiler circuit pump (see installation and service instructions).
"DHW"	"5b:1"	DHW cylinder connected downstream of the low loss header (Only set if the DHW cylinder is connected downstream of the low loss header.)
"Solar"	"02:0"	Solar circuit pump not speed-controlled
	or	
	"02:1"	Solar circuit pump is speed-controlled with wave packet control
	or	
	"02:2"	Solar circuit pump is speed-controlled with PWM control
	"20:3"	2nd differential control and auxiliary function for DHW heating
Codes Vitotronic 200-H, type HK1B		
"General"	"77:10"	Subscriber no.
	"79:0"	Control unit is not fault manager.
	"7b:0"	Control unit does not transmit time via LON.
	"97:1"	Control unit does not transmit outside temperature via LON.

Note: This scheme is a general example without shut-off valves or safety equipment. This does not replace the need for on-site engineering.

Equipment required

ID: 4605527_1604_05

Pos.	Description	Part no.
①	Boiler with	See Viessmann pricelist
②	Weather-compensated control unit	
③	Outside temperature sensor ATS	Standard delivery pos. 2
④	Low loss header	
	– 49 and 60 kW	See Vitoset pricelist
	– 80 and 99 kW	Z007 743
	– 120 and 150 kW	ZK00 658
⑤	Flow temperature sensor for low loss header	
	– 49 and 60 kW	7179 488
	– 80 and 99 kW	Standard delivery pos. 50
	– 120 and 150 kW	Standard delivery pos. 50
⑥	Heating circuit connection set with circulation pump	See Viessmann pricelist
⑦	LON communication module	7179 113
DHW heating by boiler ①		
⑩	DHW cylinder	See Viessmann pricelist
⑪	Cylinder temperature sensor STS (When using the DHW cylinder connection set, included there)	7179 114
⑫	DHW cylinder connection set with circulation pump for cylinder heating UPSB	See Viessmann pricelist
	– 49 to 60 kW	Standard delivery for DHW cylinder connection set / See Viessmann pricelist
	– from 80 kW	See Vitoset pricelist
⑬	DHW circulation pump ZP	See Vitoset pricelist
⑭	Thermostatic DHW circulation set (for DHW supply with DHW circulation) alternatively	ZK01 284
	Automatic thermostatic mixing valve (for DHW supply without DHW circulation)	7438 940
⑮	Circulation pump for transfer of heat	See Vitoset pricelist
DHW heating by solar thermal system ⑳		
㉔	Solar control module, type SM1 (alternatively incl. in Solar-Divicon standard delivery)	Z014 470
㉕	Solar collectors	See Viessmann pricelist
㉖	Solar Divicon, type PS10 with integral solar control module, type SM1 ㉔, with a pump rate of up to 1000 l/h at 6.0 m head	Z012 016
	or	
	Solar Divicon, type PS20 without control unit, with pump rate up to 1500 l/h at 6.5 m head	Z012 027
㉗	Solar circuit pump	Standard delivery pos. 22
㉘	Cylinder temperature sensor SOL	Standard delivery pos. 20
